

1.create an html form that ask the user for their name. create servlet that that will receive this information and store it in session. The servlet should then redirect the user to a page that displays their name. When the user visit the same page again the servlet should display their name from the session.

A screenshot of a web browser window. The address bar shows the URL 'localhost:8080/WebApplication3/faces/newhtml4.html'. Below the address bar, there is a text input field labeled 'Name:' containing the text 'affrin', followed by a 'go' button. A message below the input field says 'For quick access, place your bookmarks here on the bookmarks bar. [Import bookmarks now...](#)'.

A screenshot of a web browser window. The address bar shows the URL 'localhost:8080/WebApplication3/servlet08'. Below the address bar, there is a message 'welcome.....affrin' followed by a blue underlined link 'visit'. A message below the link says 'For quick access, place your bookmarks here on the bookmarks bar. [Import bookmarks now...](#)'.

A screenshot of a web browser window. The address bar shows the URL 'localhost:8080/WebApplication3/servlet082'. Below the address bar, there is a message 'hello.....affrin'. A message below the link says 'For quick access, place your bookmarks here on the bookmarks bar. [Import bookmarks now...](#)'.
